

SAVE YOUR DATA. KEEP YOUR SECURITY.

HOTSPOT DATA SAVER

A beginner-friendly PowerShell + Task Scheduler guide for Windows 10/11.

THE PROBLEM

Laptop background downloads were eating up mobile hotspot data.

THE FIX

Metered Wi-Fi + automatic connection monitoring.

THE BREAKDOWN

2 TOOLS. 1 GOAL.

The key: Windows saves data. PowerShell checks what network you are on.

01

METERED WI-FI

Limits some background transfers on your saved hotspot.

02

POWERSHELL

Detects Wi-Fi SSID and writes connection status to a log.

03

TASK SCHEDULER

Runs the script at sign-in and every 5 minutes.

DO THIS FIRST

FLIP THE SWITCH

This is the step that actually helps reduce mobile data usage.

STEP 01

CONNECT TO YOUR HOTSPOT

Open Settings > Network & Internet > Wi-Fi.

STEP 02

ENABLE METERED

Select your phone hotspot and switch Metered connection ON.

STEP 03

CHECK WINDOWS UPDATE

In Advanced options, turn OFF downloads over metered connections.

SCRIPT SETUP

BUILD THE MONITOR

The complete runnable code is in the companion HotspotDataSaver.ps1 file.

```
$HotspotSSID = "YOUR_HOTSPOT_NAME"

$LogDirectory = "$env:LOCALAPPDATA\HotspotDataSaver"

$LogFile = Join-Path $LogDirectory "hotspot.log"

# Reads the active Wi-Fi SSID

# Checks whether the connection is metered

# Logs the result (does not change settings)
```

SAVE AS

C:\Scripts\HotspotDataSaver.ps1

In Notepad choose Save as type: All Files. Replace the SSID with yours.

AUTOMATE IT

SET THE TRIGGERS

Use Task Scheduler so you never have to launch the script manually.

STEP 01

CREATE TASK

Win + R > taskschd.msc > Create Task. Name it Hotspot Data Saver.

STEP 02

ADD TRIGGERS

At log on; and daily, repeating every 5 minutes indefinitely.

STEP 03

CHOOSE ACTION

Action: Start a program. Program/script: powershell.exe

COPY THESE

ACTION SETTINGS

Paste these fields into Task Scheduler > Actions > New.

PROGRAM / SCRIPT

`powershell.exe`

ADD ARGUMENTS

```
-NoProfile -NonInteractive  
-ExecutionPolicy Bypass  
-File "C:\Scripts\HotspotDataSaver.ps1"
```

General tab: Run only when user is logged on. Conditions: allow battery operation if needed.

VERIFY

TEST IT OUT

Connect to your phone hotspot, then run the task once manually.

RUN IN POWERSHELL

```
powershell.exe -NoProfile  
-ExecutionPolicy Bypass  
-File "C:\Scripts\HotspotDataSaver.ps1"
```

CHECK LOG

%LOCALAPPDATA%\HotspotDataSaver

Open hotspot.log. You should see your Wi-Fi SSID and its connection cost.

YOU DID IT

LESS DATA.

MORE CONTROL.

- ✓ Metered connection saves data
- ✓ PowerShell monitors and logs Wi-Fi
- ✓ Task Scheduler runs checks automatically
- ✓ No need to disable Windows Update or BITS

IMPORTANT

This script does NOT switch metered mode or stop services.
Windows remembers the metered setting for your saved Wi-Fi.
